# LETTER OF SUBMITTAL

The Commonwealth of Massachusetts

Department of Public Health

Health Statistics.

Boston, June 1, 1967

To the Honorable Senate and House of Representatives:

I have the honor to submit herewith, as required by Chapter 111, Section 2 of the General Laws, the one hundred and twenty-third annual report on statistics of births, marriages, and deaths in Massachusetts for the calendar year 1964.

In accordance with Chapter 508, Acts of 1964, which transferred certain duties relative to vital statistics from the State Secretary to the Commissioner of Public Health, the registration of vital statistics remains the responsibility of the Secretary of State. These tabular results have been developed for administrative and research purposes connected with health programs and population studies.

Respectfully submitted,

Alfred L. Frechette, M.D.
Commissioner, Department of Public Health

# VITAL STATISTICS

## INTRODUCTION

Massachusetts was one of the first colonies to recognize the importance of the registration of vital statistics, and as early as 1639 required registration of births, marriages, and deaths. Since 1842 statutes have required copies to be filed with The Secretary of the Commonwealth, and the responsibility for registration of these certificates still remains with that office.

The Legislature in 1964 transferred certain duties relative to vital statistics from The Secretary of the Commonwealth to the Commissioner of Public Health for administrative and research purposes connected with health programs and population studies. This is the first report following the transfer of responsibility, and although it includes information similar to that published in prior years as part of Public Document No. 1, many tables have been deleted, and the format for tabular presentation has been changed. These statistics represent the first output of a computer program for a data base for public health programs. The computer system includes the capability of providing information on deaths due to any specific cause or causes of death, and provides tables which delineate the total deaths by age group, sex, color, and marital status. These tables may then be used for epidemiologic and other research purposes.

Tabulations are based on births, deaths, fetal deaths, marriages, and divorces registered in the office of The Secretary of the Commonwealth, with a primary emphasis upon resident data, rather than place of occurrence of the event. For historical and demographic purposes both occurrence and residence are reported.

DEFINITIONS

Residence is defined as that of the deceased for a death, and as that of the mother for a birth or fetal death. For purposes of allocation, former residents of Massachusetts who have been absent for more than one year are considered non-residents. Residents from other states who have lived in Massachusetts for more than one year are considered residents of this state, except in those cases of births and deaths in resident institutions, regardless of length of stay in the institution. Deaths and births in resident institutions are allocated to the place of previous residence.

A live birth is defined as the complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of the pregnancy, which following expulsion or extraction breathes or shows any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

An immature birth, frequently called a premature birth, is usually considered as one for which the birth weight is 2500 grams (5 pounds, 8 ounces) or less, regardless of the period of gestation.

Infant deaths are deaths of children under one year of age.

Neonatal deaths are deaths of children under twenty-eight (28) days of age.

Fetal death is death of the product of conception prior to the complete expulsion or extraction from its mother, irrespective of the duration of the pregnancy; the death is indicated by the fact that after such expulsion or extraction the fetus does not breathe or show any other evidence of life such as

beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. In Massachusetts a fetus born after a period of gestation of not less than 20 weeks must be reported.

The underlying cause of death, by which all deaths are classified, may be defined as the disease or injury which initiated the sequence of morbid events leading directly to death, or the circumstances of the accident or violence which produced the fatal injury.

It is the responsibility of the certifying physician or medical examiner to indicate the underlying cause of death, and it is the responsibility of the Health Statistics Section of the Department of Public Health to query and assign the proper code number for the classification of deaths by cause.

The comparability of mortality statistics from place to place and year to year is affected by differences in medical concepts, the manner in which certifiers report cause of death, and methods of selecting the cause of death from jointly reported causes. Changes in reporting practices have resulted from progress in medical knowledge, and in general have not caused noticeable deviations in continuity of trends. Changes in the classification systems and methods of selecting a single cause of death have had a marked effect on mortality tabulations. The Sixth Revision of International Lists of Diseases and Causes of Death and the rules for selecting the cause of death, adopted in 1949, introduced rather serious breaks in the continuity of mortality trends for a number of causes of death. Beginning with 1958, the Seventh Revision of the International Lists of Diseases and Causes of Death was used in the assignment of causes of death for Massachusetts.

In a few instances rates are given in this report; however, they are specifically limited to known findings. In the event that rates are desired, population figures for the last census year (1965) are provided in the Appendix. Two types of population information are included: 1.) Population for state, county, city and town for the past 4 census years; and 2.) population composition, sex, and age group for 1965, the last census year.

COLLECTION OF DATA

Birth registration has been compulsory in Massachusetts since Colonial times. The physician in attendance at the birth of a child is required to give notice and make a complete return of the facts required for record to the clerk of the town of birth. Parents are required to give notice to the registration official of children born to them. In addition, hospitals, or other institutions, public or private, are required to report all births to town clerks. Copies of records of births are required by statute to be forwarded to the Office of Secretary of State. As a means of eliminating errors from physicians' returns of births, Chapter 434, Acts of 1941 requires that registrars send a supplemental report of the physician's return to the parents for their verification; and when the certificate is returned properly signed by a parent, it is filed with the physician's certificate.

Death registration is accomplished by filing a standard death certificate or a medical examiner's death certificate with the local board of health. Local boards of health are required to transmit death certificates to the City or Town Clerks, who in turn record the deaths and are required to transmit certified copies to The Secretary of the Commonwealth. Hospitals and other institutions are required to obtain, when persons are received, the facts which are required for record in the event of the deaths of such persons.

Deaths investigated by medical examiners are based upon deaths supposedly due to violence or where no physician has been in attendance. Deaths supposedly due to violence include deaths caused by the action of chemical, thermal, or electrical agents, or following abortion, or from diseases resulting from injury or infection related to occupation, or suddenly when not disabled by recognizable disease, and those of persons found dead.

INTERPRETATION OF DATA

In the detailed tabulation of this report, a summary of birth and death record of events for the state, counties, cities and towns is tabulated for both occurrence and residence by sex. (See Summary Table)

Summary of Vital Events

Massachusetts, 1964

| Recorded Events by Residence | Total | Male | Female | Unknown Sex/ Not Stated |
|---|---|---|---|---|
| Live Births | 107,970 | 55,277 | 52,692 | 1 |
| Deaths (including infant and neonatal) | 55,790 | 29,371 | 26,414 | 5 |
| Infant Deaths (including neonatal) | 2,284 | 1,344 | 936 | 4 |
| Neonatal Deaths (under 28 days) | 1,683 | 996 | 683 | 4 |
| Fetal Deaths | 1,261 | 638 | 615 | 8 |
| **Recorded Events by Occurrence** | | | | |
| Marriages | 35,772 | | | |
| Divorces | 7,378 | | | |

The 107,970 live births recorded for Massachusetts residents in 1964 represents a decrease of 3,247 births from 1963. The reported 55,790 deaths are 2,816

less deaths than in 1963. The natural population increase (total births minus total deaths) was 52,180 in 1964.

Total resident deaths by sex and age show more deaths for men than for women in every age bracket through age seventy-four. Male deaths are even greater proportionately, as the female population of the state is larger for most age groups. Ratios can be determined by using the appended 1965 population tables.

A graphic presentation of Table 1 in respect to the percent of total resident deaths by age group indicates that two-thirds of the deaths of 1964 occurred in the population age 65 and above.

There were 29,369 male deaths and 26,408 female deaths reported in 1964. Findings indicate that twice as many married men as married women died, and the reverse was found for widowed populations. Approximately the same number of single males and single females died during this year. (See Table 3)

A detailed classification of cause of death for all cases of listed causes in which a resident death was reported has been compiled, using the International List number. (See Table 4)

Percentages of Total Deaths from
Five Leading Causes of Death for Massachusetts
and United States, 1964

| Cause of Death | International List Numbers | Total Deaths Mass. | Percentage of Total Deaths Mass. | -- U.S. |
|---|---|---|---|---|
| 1. Diseases of the Heart | 400-402, 410-443 | 23,364 | 41.9 | 38.9 |
| 2. Malignant Neoplasms, etc. | 140-205 | 9,871 | 17.5 | 16.1 |
| 3. Vascular Lesions | 330-334 | 5,835 | 10.5 | 11.0 |
| 4. Influenza and Pneumonia | 480-493 | 2,410 | 4.3 | 3.3 |
| 5. Accidents | 880-962 | 2,310 | 4.1 | 5.8 |
| All Other Causes | | 12,000 | 22.7 | 24.9 |
| | | 55,790 | 100.0 | 100.0 |

The foregoing table representing the percentage of deaths for the five leading causes of death in Massachusetts and the United States reflects the preponderance of deaths in the older age population. A more definitive evaluation of the death statistics for Massachusetts can be made from the findings for the five leading causes of death for each age group. (See Table 5, Group 1-12)

1. Heart Disease - Not reported as one of the five leading causes of death before the age group 30-39, where it is second only to Cancer. From that point on, heart disease is the leading cause of death for all age groups.
2. Cancer (malignant neoplasms, etc.) - It is one of the five leading causes of death for every age group above infancy (less than one year), and the leading cause of death in the (5-9) and (30-39) age groups.
3. Vascular Lesions, etc. - A few deaths from this cause are reported in the (10-14) age group, but it is listed as a major cause of death for age forty and above. From that point on, vascular lesions become the third leading cause of death up to age 79, and the second leading cause of death above that age.
4. Influenza and Pneumonia - It is one of the five leading causes of death for infants; children of 1-4 and 5-9, and for all groups sixty and above. The percentage of deaths in Massachusetts was slightly higher than that reported nationally.

5. Accidents:

   a. Non motor-vehicle - Classified for all age groups below forty, except infants (below one), and the leading cause of death for the age group 10-14. It also reappears as a major factor in the deaths of the elderly above age 79. A more detailed classification according to the type of accident has been compiled by sex and age groups. (See Table 7)

   b. Motor-vehicle - Reported as one of the five leading causes of death for the age groups: (5-9); (10-14); (15-19); (20-29); and (30-39). It is the leading cause of death for the teen-ager (15-19), and the youth population as well (20-29).

6. Suicide - A hidden statistic when viewed in relation to total death statistics for the state. Suicide is one of the five leading causes of death for the teen-agers (15-19); youth population (20-29); and middle-aged populations of (30-39) and (40-49).

Mortality statistics for fifteen selected causes of death for Massachusetts residents was developed for each of the cities and towns of the Commonwealth. (See Table 6)

INFANT MORTALITY

A total of 2,284 deaths of children below age one were recorded in 1964, with almost 90% of the deaths accounted for in the five leading causes of death for this group. (See Table 5, Group 1). Neonatal deaths (under 28 days) numbered 1,683, of which more than half (966) died during the first day of life. Total resident deaths under four weeks (neonatal) and under one year has been compiled by sex for counties, cities, and towns. (See Table 8). For a more detailed description of deaths by cause, see Table 4.

FETAL DEATHS

There were 1,309 fetal deaths reported of which 1,261 were allocated to Massachusetts residents. (See Table 10). The ratios of fetal deaths to live births reported for this state are low in comparison with known statistics from comparable populations.

Despite the insufficient reporting of fetal deaths, the findings indicate a disproportionate number of fetal deaths occurred in the "high risk" maternity age groups - teen age, and above the age of thirty-four - when compared with "normal" child-bearing ages of 20-34. (See Birth Table 1). As only 27 fetal deaths were reported from other than a hospital setting, it is obvious that physicians are not reporting fetal deaths. (See Birth Table 3)

IMMATURE BIRTHS

There were 7,978 immature births (birth weight 5 pounds, 8 ounces or less) reported for Massachusetts residents in 1964. This total represented 7.4 percent of the total live births. Of the reported 1,261 fetal deaths, a total of 692 or 54.9 percent were five pounds, eight ounces or less. (See Birth Table 2)

MARRIAGES

The number of marriages recorded in Massachusetts during 1964 were 35,772, a decrease of 199 below the previous year. Of the total marriages, 39.1 percent involved at least one non-resident partner. In this group 11,312 marriages involved Massachusetts resident brides, and 2,707 Massachusetts resident grooms. Approximately one-fourth of the total marriages were composed of bride and groom non-residents, and 36.8 percent of marriages were of resident bride and groom. (See Marriage Table 1)

DIVORCES

In Massachusetts 7,378 divorces were reported as granted by the County Probate Courts in 1964, as compared with 5,950 reported in 1963. There were 163 annulments granted as well. A historical comparison of divorces can be found in Divorce Tables 3, 4, and 5.
